Project Overview and Objectives

Implementation Scope

ServiceNow implementation encompasses comprehensive access control and workflow automation across eight structured phases. This initiative enables organizations to establish secure user management, streamline approval processes, and implement governance frameworks through Flow Designer automation and role-based access controls.

Key Implementation Areas

Phase 1-2: Requirements Analysis and Design

Activity	Deliverable	Success Criteria
Current State Assessment	AS-IS Process Documentation	100% coverage of existing workflows
Stakeholder Interviews	Requirements Matrix	Approval from all departments
Access Pattern Analysis	Permission Mapping Report	Identified role taxonomy
System Integration Review	Integration Scope Document	All systems catalogued
Risk Assessment	Risk Register	Mitigation plans defined

1

Access Control Architecture
Design multi-layer ACL strategy covering tables, fields, and record-level permissions

2

User Role Structure
Define roles aligned with organizational hierarchy and functional requirements

3

Workflow Blueprint
Document automated processes using Flow Designer components

4

Data Migration Plan
Strategy for importing existing users, groups, and access configurations

Phase 3-4: User Management and Groups Configuration

1

User Provisioning Process

Automated user creation through HR system integration or manual workflow

2

User Deprovisioning

Scheduled removal of inactive users and access revocation procedures

3

User Properties

Configuration of user fields (name, email, department, location, manager)

4

Batch Import

Bulk user creation from CSV or HR database sources

5

User Self-Service

Portal enabling users to update profile information and request access

Configuration Element	Purpose	Implementation Approach
Department Groups	Organize users by business unit	Map HR organizational structure
Functional Groups	Role-based user collections	Define groups for Finance, IT, HR, etc.
Dynamic Groups	Rules-based automatic membership	Criteria: location, role, cost center
Cross-functional Teams	Project or initiative-based groups	Manual assignment with expiration dates
Manager Groups	Hierarchical approval chains	Linked to user manager field

Phase 5: Roles and Access Control Lists

ACL Type	Scope	Configuration Details
Table ACL	Table-level access	Controls read, create, update, delete operations
Field ACL	Column-level access	Restricts visibility and editability of specific fields
Record ACL	Row-level access	Query-based filters for data subset access
Script ACL	Server-side security	Protects sensitive business logic execution
UI Policy ACL	Interface elements	Controls visibility of buttons, tabs, and sections

Phase 6: Flow Designer Automation and Workflows

Component	Use Case	Business Value
Trigger	Incident creation or request submission	Initiates automated response process
Condition	Evaluate priority or urgency level	Routes workflow based on business rules
Action	Create tasks, send notifications	Executes immediate system operations
Loop	Process multiple records iteratively	Enables bulk operations within workflow
Decision	Parallel approval routing	Optimizes multi-party authorization
Wait	Introduce time delays	Allows sequential process timing
Subflow	Reusable workflow components	Promotes consistency and reduces duplication

Phase 7: Governance and Compliance

Access control governance establishes policies, procedures, and monitoring mechanisms to ensure security and compliance throughout the system lifecycle.

Access Review Process

Quarterly or semi-annual certification of user access by managers

Segregation of Duties (SoD)

Policy engine to prevent conflicting role assignments

Audit Trail Configuration

Enable comprehensive logging of access changes and system modifications

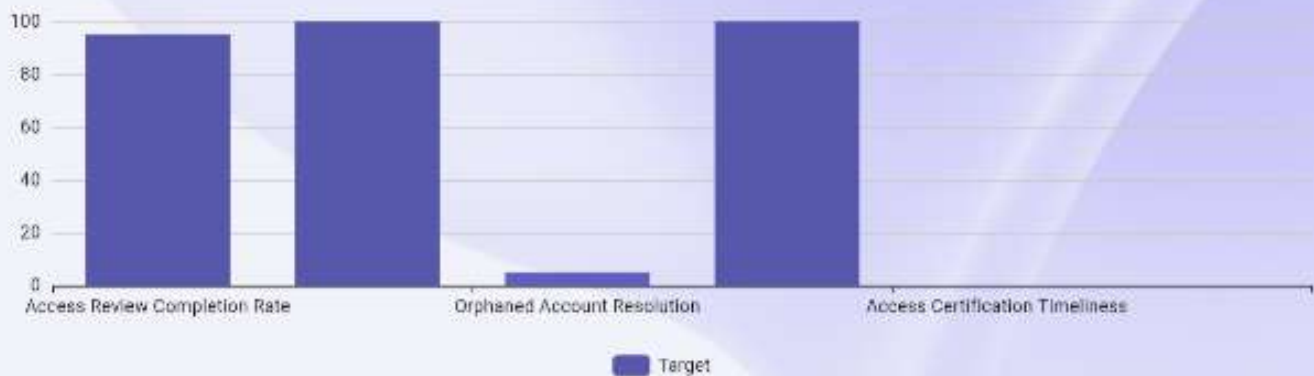

Change Control

Approval workflow for role, ACL, and permission modifications

Compliance Reporting

Automated reports for internal audit and external regulatory requirements

Security Metrics vs Targets

Phase 8: Testing and Quality Assurance

Unit Testing

Validate individual ACLs, roles, and workflow steps for correct behavior

Integration Testing

Verify Flow Designer workflows interact correctly with external systems

User Acceptance Testing (UAT)

Business stakeholders validate workflows match requirements

Security Testing

Penetration testing and access control verification to prevent unauthorized access

Performance Testing

Load testing workflows and ACL evaluation under concurrent user scenarios

Test Category	Key Validation Points	Acceptance Criteria
User Access	Users can access assigned records	Zero unauthorized access
Field Visibility	Fields display correctly per permissions	100% compliance with ACL rules
Workflow Execution	Flows execute in correct sequence	All tests pass without exceptions
Notification Delivery	Messages reach intended recipients	100% delivery confirmation
Data Integrity	No data loss or corruption during sync	Reconciliation reports match
Audit Logging	All changes recorded with timestamp	Complete audit trail verification

Phase 9: Deployment and Project Closure

Closure Activity	Responsibility	Timeline
Lessons Learned Session	Project Manager	Week 1 post-deployment
Final Documentation Review	Technical Lead	Week 1 post-deployment
Knowledge Base Creation	Support Team	Week 2 post-deployment
Stakeholder Sign-Off	Steering Committee	Week 2 post-deployment
Resource Release	Program Manager	Week 3 post-deployment
Handover to Operations	Support Manager	Week 3 post-deployment
